Application Functional Requirements: Internal IT Helpdesk Platform

Introduction

The Internal IT Helpdesk Platform is a centralized web-based solution designed to streamline the reporting, tracking, and resolution of technical issues within the company. Its primary goal is to provide employees with an intuitive interface for requesting IT support, while equipping IT agents with robust tools to manage their workload, track performance metrics, and maintain a comprehensive knowledge base for self-service problem resolution.

Functional Requirements

1. Authentication and User Management Module

- Secure Authentication: Secure login via company email/password, featuring "Remember Me" and password recovery.
- Account Registration: New users can request an account by providing personal info and department details.
- Role-Based Access Control: Strict access separation: *Employees* (submit/track personal tickets) and *IT Agents* (manage/resolve assigned tickets).
- Profile Management: Users can update contact details and toggle email/desktop notifications.

2. Core Ticket Management Module

- Ticket Submission: Structured form capturing issue title, category, priority level, and description.
- Centralized Ticket Catalog: Tabular view displaying all tickets with their ID, requester, priority, and date.
- Search and Filtering: Dynamic list filtering by status/priority, plus a text search by ticket ID or title.
- Resolution Workflow: IT Agents can manually update ticket statuses (Open → In Progress → Resolved → Closed).

3. Communication and Collaboration Module

- Discussion Threads: Dedicated chat-like interface inside each ticket for messages between employees and agents.
- Automated System Logs: The platform generates automated status messages directly within the chat thread.
- Ticket Locking: Discussion threads are automatically locked to prevent replies once a ticket is marked "Resolved" or "Closed".

4. Knowledge Base and Self-Service Module

- Categorized Repository: A centralized library of help articles and tutorials, logically grouped by IT categories.
- Global Search Engine: Search bar for quick access to documentation, aiming to reduce submitted ticket volume.

5. Dashboard and Analytics Module

- Real-Time Metrics: Visual dashboard with KPI cards for Open, In Progress, Resolved, and Service Level Agreement breached tickets.
- Activity Feed: Summary list of recently updated tickets and urgent system notifications.

Non-Functional Requirements

- Performance: The platform must load pages in under 4 seconds and be capable of handling simultaneous ticket submissions without data loss.
- Security: All user passwords must be securely hashed using industry-standard encryption before being stored in the database.
- Compatibility: The user interface must be fully responsive and optimized for modern web browsers (Chrome, Edge, Firefox) across desktop and mobile devices.
- Availability: The system targets a 99.9% uptime, ensuring IT support is accessible during critical business hours.
